

Accessing ViewPoint

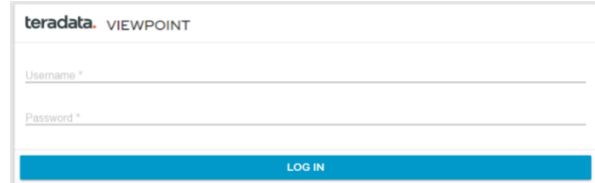

Teradata ViewPoint is a browser-based application whose primary purpose is the use of SQL statements. ViewPoint offers SQL Scratchpad, a program with limited functionality allowing faculty and students to execute simple SQL queries for the datasets for which you have been given access.

1. Navigate to <https://uatdviewpoint.waltoncollege.uark.edu/login.html>

2. Enter the following login credential:

Username: find yours in the table below
(Starting with CLEM)

Password: tvyb2}n?^9M8seR

The screenshot shows the Teradata ViewPoint login interface. At the top, it says 'teradata. VIEWPOINT'. Below this are two input fields: 'Username *' and 'Password *'. At the bottom of the form is a blue button labeled 'LOG IN'.

- Click “Select System” beside the title “SQL Scratchpad” and then click “UofAIFX”.

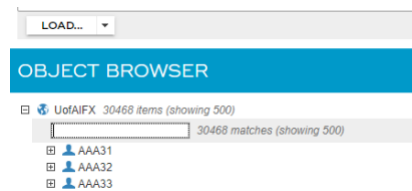

- Enter your individual username and password shown in the table above.

If the pop-up box goes away, your username and password entry is successful. You can ignore the fields “Account String”, “Authentication Mechanism”, and “Character Set”.

 A screenshot of the 'Connect to System' dialog box. It has a blue header bar with the text 'Connect to System'. Below the header, there are several input fields: 'System: UofAIFX', '* Username: [text box]', '* Password: [text box]', 'Account String: [text box]', 'Authentication Mechanism: [dropdown menu showing DEFAULT]', and 'Character Set: [dropdown menu showing UTF8]'. At the bottom right, there are two buttons: 'CONNECT' and 'CANCEL'.

- Click “Load” and then “Insert Object” to find your desired database.

We will be querying from “db_pvfc11_big” in this course. The list of tables and columns is appended in this document.

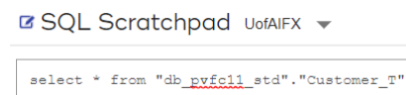

Once you find db_pvfc11_std, you can explore the tables that reside under this database and the associated views.

6. Click on the table you want to query and select “Insert Object” below.

In this case, we will be querying db_pvfc11_std.Customer_T. The above box will be filled with the database name followed by the table name with a “.” in between. We will alter this to be an appropriate SQL statement.

7. Type “SELECT * FROM” before the populated content and then click “Run”.

SQL Scratchpad will show you the query typed and the results from that query including the column names and data rows. You can also click the “SQL” tab beside “Results” to see the specific SQL statement used to generate those results.
